## Marginal Effects function
TwayME.f <- function(M, X, Z, level)
{
  ## A function to generate 2-way marginal effects plots in R.
  ## Written by Joshua Gubler ~ http://scholar.byu.edu/jgubler; originally
  ## based on Stata code from Joel Selway and Brambor, Clark, and Golder.
  ## Last modified: 12 October 2014 (Move to ggplot2 and reduce output to
  ## values rather than graph - David Romney)
  ## Variables must be in the following order: y = x z (control variables
  ## here) xz. The model can include as many control variables as you need.
  ## M = an object of type "lm," "glm," or other estimation -- i.e. the object
  ## that contains the regression estimation you seek to plot.
  ## X = the variable whose effect on Y you seek to plot
  ## Z = the moderating variable (will be positioned on the X-axis of the
  ## plot)
  ## xlab = label for x-axis (in quotes)
  ## ylab = label for y-axis (in quotes)
  ## level = to set the confidence level. Two options (don't put these in
  ## quotes): 95, 90. If you do not specify either option, the confidence
  ## intervals will not be correct.
  ## Example: TwayME.f(estimation.lm, ses, edu, "Education levels",
  ## "Effect of SES on Civil War", 90)

  S <- summary(M)
  N <- c(1:20)

  ## 20 equally-spaced values for the moderating variable
  zmin <- rep(min(Z, na.rm = TRUE), 20)
  zmax <- rep(max(Z, na.rm = TRUE), 20)
  Znew <- (((N - 1) / (20 - 1)) * (zmax - zmin)) + zmin

  ## Grab elements of coefficient and vcov matrix
  H <- head(S$coefficients, 3)
  T <- tail(S$coefficients, 1)
  b <- rbind(H, T)
  Vcov <- vcov(M)
  Vcov <- as.data.frame(Vcov)
  Vcov1 <- Vcov[, c(1:3)]
  Vcov2 <- Vcov[, -c(0:0 - length(Vcov))]
  Vcov <- cbind(Vcov1, Vcov2)
  Vh <- head(Vcov, 3)
  Vt <- tail(Vcov, 1)
  V <- rbind(Vh, Vt)
  b1 <- b[2, 1]
  b2 <- b[3, 1]
  b3 <- b[4, 1]
  varb1 <- V[2, 2]
  varb2 <- V[3, 3]

```

```

varb3 <- V[4, 4]
covb1b3 <- V[4, 2]
covb2b3 <- V[4, 3]

## Calculate ME values
conb <- b1 + b3 * Znew

## Calculate standard errors when W = 0, W = 1, W = 2, W = 3, and when W = 4
conse <- sqrt(varb1 + varb3 * (Znew^2) + 2 * covb1b3 * Znew)

## Upper and lower CIs
ci <- NA
ci[level == 95] <- qnorm(0.975)
ci[level == 90] <- qnorm(0.95)
a = ci * conse
upper = conb + a
lower = conb - a

## Return values
return(data.frame(Znew, conb, upper, lower))
}

#####
#### Load and clean the study 1 data
#####

## Some initial pre-processing of the data was done to remove all identifying
## variables and rename some other variables - the code used to do this can be
## found in this section (commented out so that it doesn't run as this has already
## been done to the included data file)

## Note that a few of the variable names/values used in the code below contain
## acronyms that would be identifying, these have been marked out with
## asterisks

## ## Clear workspace
## rm(list = ls())

## ## Packages
## library(foreign)
